VOLUME 52, NUMBER 13 | JUNE 27, 2014

## **ALL THINGS CONSIDERED - A USGA STAFF OPINION**

GOLF COURSE AND TURFGRASS MANAGEMENT: FROM ART TO SCIENCE

John Foy, director, Florida Region

Fla., emphasizes that it is important to get out of the office, change up your routine, and spend some time on a fairway unit, mow a few greens, or put the paint gun to use marking the course.

reported that the first greenkeeper positions in Scotland were established by the end of the 1700s. Trial-and-error experiences of early greenkeepers were the foundation of the art of golf turf culture. The first scientific papers related to turfgrass research were published in the late 1800s, but it was not until the 1920s when the USGA created the Green Section that the development of scientific information relating to golf course turf began to occur. In the article "Maintenance Changes from Art to Art and Science," published in the April 1952 issue of Golfdom magazine, Hank Miller, superintendent at Briergate Golf Club in Deerfield, III, wrote about the evolution of course management during his career and how science was playing an increasing role. If one takes Kyle Sweet, CGCS, The Sanctuary Golf Club on Sanibel Island, a moment to contemplate the tremendous advances that have been made in science and technology in every aspect of life over the past 60 years, it is certainly easy to understand why art has become a less recognized component in modern-day course management.

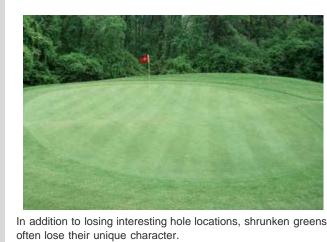

In James B. Beard's book, "Turf Management for Golf Courses," it is

Advances in the science of turfgrass management have greatly improved golf course conditions. However, the art of greenkeeping still plays an important role in course presentation and golfer enjoyment.

LOOKING TO IMPROVE AESTHETICS AND PLAYABILITY ON A BUDGET? BEGIN BY "FIXING" CONTOURS ON GREENS Dave Oatis, director, Northeast Region

static, or worse yet going backward, while other courses are upgrading their facilities can be detrimental to business in a competitive industry. Course improvements come in a variety of shapes and sizes. Upgrading agronomic programs to provide better turf and improved playing conditions is a very sound approach. Many golf facilities develop master plans and subsequently implement extensive course renovation projects. However, spending a lot of money on course upgrades does not guarantee success. Poorly conceived master plans can have detrimental effects on playability and the maintenance budget. Even the best course improvements will be met with failure if basic agronomic programs are ignored. The difference in course improvement programs is partially a reflection

of the diverse financial health of golf facilities. Some have the resources

Just about everyone wants to improve their golf course. Remaining

to implement expensive, ambitious improvement programs and upgrade maintenance programs, whereas others struggle to find ways of keeping the doors open and meeting daily expenses. What would you say if I told you of a program that could have a significant and very positive effect on playability at most golf courses

and can usually be accomplished without tremendous expense? It probably sounds too good to be true, but the fact is many golf facilities can make major improvements in playability by "fixing" mowing contours.
